

What is Wazuh (SIEM & XDR) for SOC Analysts

1- Wazuh Overview

Wazuh is an open-source security platform used in cybersecurity for threat detection, log analysis, and incident response. It helps organizations monitor and analyze security events across their IT infrastructure.

Wazuh functions as a Security Information and Event Management (SIEM) solution—a centralized system designed for real-time monitoring, threat detection, and compliance management by aggregating and analyzing security data. Furthermore, it operates as an Extended Detection and Response (XDR) platform, which unifies security visibility and automated threat prevention across endpoints, networks, and cloud workloads.

To achieve this, Wazuh collects log data from firewalls, servers, endpoints, and applications, then analyzes that data in real time to detect suspicious activities and mitigate threats effectively.

2- Wazuh Capabilities

Question: Why use Wazuh?

Answer1: For real-time detection

Means: Wazuh uses predefined rules and machine learning techniques to identify anomalies and potential threats.

Answer2: For log analysis

Means: Wazuh collects and correlates system logs to trace security breaches.

Answer3: For Incident response

Means: Wazuh generates alerts and, in some cases, initiates response actions like blocking SSH brute-force attacks.

Answer4: provides Compliance and reporting

Means: Wazuh provides reporting and auditing features for compliance standards like PCI DSS, GDPR, and HIPAA.

3- Wazuh Capabilities and Integration

Question: What is the role of Wazuh in cybersecurity?

First role: Threat hunting.

By using Wazuh, security teams proactively find threats. Using features like:

- file integrity monitoring (FIM)
- and Yara tools integration.

Second role: Integration

Wazuh can integrate with tools like

- Suricata IDS,
- Wireshark,
- and Graylog (Syslog)

to provide multi-layered security.

Third role: Scalability

Wazuh is suitable for both small and large organizations and provides scalability according to their organization and infrastructure needs.

What is Wazuh (SIEM & XDR) for SOC Analysts

Open-Source Security Platform for Threat Detection, Log Analysis, and Incident Response

 Detect Threats Faster
  Analyze Logs in Real-Time
  Respond to Incidents
  Ensure Compliance
  Integrate with Your Tools

WAZUH

SIEM | XDR

Open Source. Real Security. Greater Visibility.

1 Wazuh Overview

Wazuh is an open-source security platform used in cybersecurity for threat detection, log analysis, and incident response. It helps organizations monitor and analyze security events across their IT infrastructure.

A centralized system for real-time monitoring, threat detection, and compliance management by aggregating and analyzing security data.

Unifies security visibility and automated threat prevention across endpoints, networks, and cloud workloads.

How it works

Wazuh collects log data from firewalls, servers, endpoints, and applications, then analyzes that data in real time to detect suspicious activities and mitigate threats effectively.

Wazuh Architecture & Data Flow

2 Wazuh Capabilities (Why Use Wazuh?)

- 2.1 Real-time detection**
 Wazuh uses predefined rules and machine learning techniques to identify anomalies and potential threats.
- 2.2 Log analysis**
 Wazuh collects and correlates system logs to trace security breaches.
- 2.3 Incident response**
 Wazuh generates alerts and, in some cases, initiates response actions like blocking SSH brute-force attacks.
- 2.4 Compliance and reporting**
 Wazuh provides reporting and auditing features for compliance standards like PCI DSS, GDPR, and HIPAA.

How Wazuh Works (Monitoring → Response)

Key Benefits

- Open Source**
No licensing cost, active community
- Unified Visibility**
See your entire environment in one place
- Automated Response**
React to threats quickly
- Compliance Ready**
Built-in reports and auditing
- Scalable**
Suitable for small and large organizations
- Flexible Integration**
Works with many security tools

3 Wazuh Capabilities and Integration

- 3.1 Threat hunting**
 By using Wazuh, security teams proactively find threats. Using features like:
 - File integrity monitoring (FIM)
 - Yara tools integration
- 3.2 Integration with other tools**
 Wazuh can integrate with tools like:
 - Suricata IDS
 - Wireshark
 - Graylog (Syslog)
 to provide multi-layered security.
- 3.3 Scalability**
 Wazuh is suitable for both small and large organizations and provides scalability according to their organization and infrastructure needs.

Security Ecosystem Integration

Use Cases for SOC Analysts

- 1 Monitor and detect suspicious activities across endpoints, network, and cloud.
- 2 Investigate security incidents using correlated logs.
- 3 Hunt for threats using FIM and Yara.
- 4 Automate response actions to contain threats.
- 5 Generate compliance reports for audits.
- 6 Integrate with other tools for a strong defense-in-depth strategy.

Key Takeaway

Wazuh combines the power of SIEM and XDR in an open-source platform, helping SOC analysts detect, analyze, and respond to threats efficiently, while ensuring compliance and scalability.

"Better Visibility.
Stronger Security.
A Safer Tomorrow."
